Glossary of Services

Botox & Dysport

Muscle relaxing agents that visibly reduces wrinkles and fine lines by temporarily relaxing specific muscles. The most common areas of treatment are frown lines of the forehead, crow's feet, and lines between the eyes.

Chemical Peel

Customized chemical exfoliation that dissolves dead skin cells off the epidermis revealing fresh, new, bright skin. Chemical exfoliation helps to improve the appearance of photodamage, post-inflammatory hyperpigmentation, pore size, fine lines, and wrinkles. Regular chemical peels can dramatically improve problematic skin.

Cryo Treatment

Anti-inflammatory, antibacterial freezing procedure that calms problematic or acneic skin. This cooling treatment reduces the appearance of fine lines, wrinkles, hyperpigmentation, laxity, dullness, and imperfections.

Dermaplaning

A simple, safe procedure for evenly exfoliating the epidermis and ridding the skin of fine vellus hair (peach fuzz). The result is a more refined, smooth, glowing appearance and is a great treatment to have prior to a big event. This procedure can be combined with most chemical peels allowing for deeper penetration.

Laser Hair Reduction

A quick, noninvasive way to permanently reduce unwanted hair for both men and women. It can be performed on virtually all areas of the body where dark hair grows.

Laser Skin Resurfacing (non ablative)

Skin tightening treatment that promotes the production of collagen. This treatment diminishes the appearance of fine lines, wrinkles, sagging skin, acne, or surgical scars, stretch marks, and melasma.

Medical Weight Loss

Weight loss programs are physician supervised and include appetite suppressants and diet counseling.

Microneedling

Stimulates natural collagen production while allowing fine channels to be created in the skin to increase topical nutrient absorption. This allows for treatment delivery deep into the skin's fibroblasts to feed the cells found in the dermis and basal layer. This treatment is perfectly paired with stem cell therapy (PRP or AnteAge Growth Factor).

Photofacial

Diminishes fine lines, pore size, redness, broken capillaries, sun damage, and pigmentation problems. Treatment targets pigment below the skin surface to reverse signs of aging and sun damage without requiring downtime of laser resurfacing. Photofacial Therapy also reduces redness caused by rosacea.

PRX-T33

Targets the dermal layer and causes inflammation to stimulate tightening and collagen production without having superficial down time. Clients leave with beautiful, glowing skin post treatment. It can be done throughout the year as it doesn't photosensitize the skin. No needles are used and it is a pain-free procedure.

Stem Cell Facials

AnteAge® stem cells are microchanneled into the skin to deliver growth factors that stimulate collagen and repair activity to create facial rejuvenation. Pain free and no downtime.
